Introduction • oo Basic method • oo Order constraints Interpolation • oo Order constraints Order Conclusion • oo Order Conclusion

- Crowdsourcing: reducing hard problems to elementary queries asked to an indiscriminate crowd of human users
- Crowd data sourcing: extracting knowledge from the crowd
- ⇒ Would you recommend this restaurant for Indian food?
- ⇒ What is the topic of the following text?
- ⇒ Which of these designs seems neater to you?

Introduction	Basic method	Order constraints	Interpolation	Conclusion
OOO	00000		00	O
Answers are	uncertain			

- Crowd answers are noisy!
  - How would you rate the quality of this sound file?
    - ⇒ 8/10
    - ⇒ 7/10
    - $\Rightarrow$  5/10 (didn't actually listen)
    - $\Rightarrow$  1/10 (has lousy headphones)
    - $\Rightarrow$  10/10 (has poor taste)
  - Truth finding approaches but still different tastes
- $\Rightarrow$  We are interested in the average answer

## Problem statement

- We have a bunch of questions
  - $\Rightarrow$  What is the quality of file i?
- We want to be efficient
  - ⇒ Don't ask too many questions
  - $\Rightarrow$  Compute quickly the next question to ask
- We have an overall objective
  - $\Rightarrow$  Which file has average quality rating closest to 7/10?
- $\Rightarrow$  How to choose our next question?

#### 5 Conclusion

Introduction	Basic method	Order constraints	Interpolation	Conclusion
000	•0000		00	O
Crowd mod	el			

- For each question i, a random variable  $X_i$  to model answers
- Asking a question means getting a observation
  - $\Rightarrow$  User gave grade 4/10 to file i
- Our desired answer is the unknown mean of  $X_i$ 
  - ⇒ Average user grade for file i
- Objective: minimize the loss of our current prediction
- Overall loss is a sum of each question's loss
  - $\Rightarrow$  How many files are misclassified w.r.t. the threshold 7/10

Introduction	Basic method	Order constraints	Interpolation	Conclusion
000	⊙●○○○		00	O
Normal vari	ables			

So far, the questions are independent. Consider file *i*:

- We have already obtained answers S
- We assume the random variable X<sub>i</sub> is Gaussian
- Unknown parameters of  $X_i$ 
  - $\Rightarrow$  Mean  $\mu$  (desired answer)
  - $\Rightarrow \text{ Variance } \sigma^2$

Basic method

Order constraints

Interpolation 00 Conclusion O

# Maximum Likelihood Estimation

- Maximum likelihood estimator  $(\widehat{\mu}, \widehat{\sigma}^2)$  for S:
  - $\Rightarrow~\widehat{\mu}$  is the sample mean
  - $\Rightarrow \hat{\sigma}^2$  is the sample variance
  - $\Rightarrow$  Those parameters give the highest probability to S
- Example: answers  $S = \{7/10, 9/10\}$

$$\Rightarrow \hat{\mu} = 8/10$$

Introduction	Basic method	Order constraints	Interpolation	Conclusion
000	000●0		00	O
Error estima	ation			

- $\bullet$  Assume that our guess  $(\widehat{\mu},\,\widehat{\sigma}^2)$  is the truth
- Consider which answers we could have obtained: How often would we still believe  $(\hat{\mu}, \hat{\sigma}^2)$ ?
  - $\Rightarrow$  Say we see answers  $S = \{1/10, 9/10\}$
  - $\Rightarrow~\widehat{\mu}=5/10$  and high  $\widehat{\sigma}^2$
  - $\Rightarrow$  Under  $(\widehat{\mu}, \widehat{\sigma}^2)$  we could have seen  $S' = \{2/10, 3/10\}$
  - $\Rightarrow$  We would have guessed  $(\widehat{\mu}, \widehat{\sigma}^2)$  differently then
- Formally: expected loss of the MLE for outcomes under the estimated distribution according to the computed MLE.

### Best error decrease

- We can estimate our error...
- ... but how much does one more answer help?
- Our predicted  $(\widehat{\mu}, \widehat{\sigma}^2)$  tells us which answers to expect
- We can compute a new error estimation for each answer
- $\Rightarrow$  Average error decrease, under the estimated distribution

Overall, we should ask the question with the highest decrease.

1 Introduction

### 2 Basic method

Order constraints

Interpolation

#### 5 Conclusion

## Order on numerical answers

- The previous approach assumes independent variables
- Sometimes, they are ordered
  - $\Rightarrow$  Sound file quality with various compression levels
  - ⇒ Target price for various deals (flight, flight and hotel)
  - ⇒ Frequency of activity combinations (beach, beach and surfing)
- Order on true answers but not on our observations!
  - User A rates lossless with 6/10
  - User B rates high compression with 8/10
  - ⇒ Monotonicity only on the mean values!

Introduction 000 Basic method

Order constraints

Interpolation 00 Conclusion O

## Joint distribution and MLE

- We assume normal distributions
- Parameters  $(\mu_i, \sigma_i^2)$  for each variable
- Assumption  $\mu_1 < \mu_2 < \cdots < \mu_n$
- What are the most likely parameters in this space?
- $\Rightarrow$  No obvious closed form for the MLE

Introduction 000 Basic method 00000 Order constraints

Interpolation 00 Conclusion O

# Approximating the MLE

- Approximation: first determine the mean values
  - $\Rightarrow$  Enforce the monotonicity constraint
  - $\Rightarrow$  Remain close to the sample mean of each variable...
  - $\Rightarrow$  ... depending on the sample variances
- $\Rightarrow$  Least squares under linear inequalities: quadratic programming
- $\Rightarrow$  Then readjust the variances based on those means

Estimated error and error decrease like before (but for all variables).

Interpolation

#### 5 Conclusion

- We have a large collection of totally ordered variables
  - $\Rightarrow$  e.g., 100 possible bitrate levels
- We want to find a threshold value
  - $\Rightarrow$  Which is the strongest compression with quality  $\geq 7/10?$
- We cannot ask questions about all variables
- $\Rightarrow$  Under exact answers: interpolation search

## Interpolation issues

- Linear interpolation for the means
- Which interpolation for the variances?
  - $\Rightarrow$  Variance from the neighboring points
  - $\Rightarrow$  Variance from the interpolation uncertainty
- Computing expected decrease for each point may be too slow!

Introduction	Basic method	Order constraints	Interpolation	Conclusion
000	00000		00	•
Conclusion				

- A general scheme to choose questions in crowd data sourcing
- A method to incorporate order constraints on the variables
- Ways to perform interpolation for questions with no answers
- Ongoing work:
  - $\Rightarrow$  A general interpolation scheme for arbitrary partial orders
  - $\Rightarrow$  Support for complex queries
  - $\Rightarrow$  Other criteria to choose next question
  - ⇒ Experiments for activity recommendations
